

HEALTHCONNECT CLINIC EXPERIENCE LAB

WEEK 5 CROSS-TRACK COLLABORATION RECORD

Improving Patient Appointment Attendance and Healthcare Support Using Data and AI

Document Control

Project	HealthConnect Clinic Experience Lab
Project Title	Improving Patient Appointment Attendance and Healthcare Support Using Data and AI
Track	Project Management
Reporting Period	Week 5
Document Type	Cross-Track Collaboration Record
Status Date	3 September 2026
Version	1.0
Document Owner	Project Management Function
Status	Active

1. TRACK INTERACTED WITH

Data Analytics — Analytics & Insights

2. INFORMATION / OUTPUT EXCHANGED

The Data Analytics track shared its Week 5 execution position and analytical outputs, including completed data preparation and validation, exploratory analysis, six key performance indicators (KPIs), an executive Power BI dashboard, and identified patterns in patient appointment attendance and no-shows.

The information exchanged covered the overall no-show position, previous no-show history, appointment timing, reminder-channel patterns, distance-related observations, and other variables considered during the analysis.

3. WHY THE INTERACTION WAS RELEVANT

The interaction was relevant to Project Management because the analytical outputs represent an important evidence input to downstream project decisions.

The findings provide a basis for subsequent predictive intelligence, patient-engagement planning, intervention design and outcome measurement, while also giving Project Management visibility into the maturity of the analytical work and the inputs that may be required by other workstreams.

The discussion also helped distinguish observed patterns from findings requiring further validation, supporting more controlled decision-making before analytical outputs are carried into downstream solution activities.

4. PROJECT MANAGEMENT CONTRIBUTION

Project Management reviewed the emerging findings and raised specific areas for further analytical consideration, including:

- The relationship between distance, reminder channel and previous no-show history within the 30–40 km patient group;
- Whether booking lead time demonstrated a meaningful attendance pattern;
- Whether the analysed cancellation data contained findings relevant to the project; and
- Which KPIs should serve as practical baseline measures for post-intervention evaluation.

These points were raised as questions for further validation rather than as predetermined conclusions.

5. WHAT CHANGED OR IMPROVED AS A RESULT

The interaction improved project visibility of the analytical position and identified specific areas for deeper investigation in the next phase, particularly around booking lead time and the relationship between distance, reminder channels and previous no-show behaviour.

It also established No-Show Rate and Show Rate as practical baseline measures for assessing post-intervention change. This provides the project with a clearer reference point for evaluating whether subsequent interventions produce measurable improvement in appointment attendance.

The collaboration therefore strengthened the connection between analytical evidence and project-level decision control, while creating clearer inputs for the next stage of work.

6. COORDINATION SIGNIFICANCE

The interaction demonstrates the Project Management function operating as a coordination and integration layer between specialist workstreams: receiving relevant outputs, testing their project implications, identifying areas requiring further clarification, and ensuring that validated evidence can support downstream planning and evaluation.

Collaboration Outcome

End of Week 5 Cross-Track Collaboration Record
